hand pressure. Thirdly, the prior art clamshell design does not provide elevation adjustment or azimuth angle adjustment means. This restricts the ergonomic usability of the prior art computer and display units.

5 For example, U.S Patent 4,859,092 of Makita discloses a portable typewriter and display unit. However, a single pair of pivoting arms connect the display unit to the main body. When its display unit is raised to its highest elevation, the distance from the user's eyes to the display screen is large. Therefore, middle aged users who are near sighted, will have difficulty in viewing the screen. No pen/stylus input mean is disclosed, but even if one is added, the display unit would not provide a physically secure writing surface. The Makita does not provide a means of placing equal and opposite restraining force onto the display unit. U.S. Patent 4,624,434 of Lake discloses a tilttable display terminal, but no display unit elevation adjustment is taught. Again no pen input means is disclosed, and if one is added, the unit would not be physically stable for normal hand/arm forces applied by the user. U.S. Patent 5,115,374 of Hongoh teaches a laptop portable computer with a facsimile function. Hongoh discloses a touch panel screen, but no pen input means, and no vertical elevation adjustment of its display unit is taught. In order to provide a horizontal display orientation, the display unit must be detached from the main body and set back, in reverse orientation, to the connector sockets on the main body, which is a severe disadvantage.

Several prior art pen computer units exist. However, their display screens are fixed to their enclosure to form a flat tablet. They are designed for the mobile user market. This limits their use for desktop pen/stylus computing environments. No prior art 30 has solved the problem of a personal computer for the office environment, capable of standard computing, pen computing, and voice telephone communications.

The invention disclosed herein solves the above problems by providing an ergonomic designed desktop system that is capable of 35 several important computer and communications functions. It provides a display panel assembly, pen/stylus input unit, multiple support arms, and a main unit in a roughly wedge shape. The display panel assembly can be adjusted in inclination angle, azimuth angle and elevation. Thus invention overcomes the problems 40 of the prior art. For example, the display panel of the invention can be easily adjusted by hand in elevation to a height roughly of the user's eye level. The user does not have to look down to see the screen when in normal PC-keyboard operation. If the unit is used as a pen/stylus computer, the display panel can be folded by

hand to a physically secure position, at an inclination angle that is ergonomically correct for handwriting and sketching. Finally, the display screen can be physically adjusted in many orientation combinations, including azimuth angles, inclination angles and 5 elevation translations. Thus the invention can be used in a wide range on office desktop positions and by a wide range of users and orientations.

SUMMARY OF THE INVENTION

The disclosed invention overcomes the shortcomings of the 10 prior art by providing display screen adjusting means for desktop computers and terminals, such that the entire apparatus is sufficiently small to be portable or transportable. The invention disclosed herein provides an easy to use desktop workstation, to which the human user can adjust its screen for many screen positions. In addition, the workstation can fold down for transport. 15 The workstation may also include external communication means such as voice/data modem and/or telephone means.

Accordingly an object of the invention is to provide small 20 compact workstation for the office, having an array of useful functions and capabilities at the finger tips of the human user sitting at his/her desk. Functions may include pen/stylus input means, computer means, display device(s), mass memory devices, keyboard, mouse, speaker phone, network interface and modem.

Another object of the invention is to give the user a voice 25 and data communications capability at the desktop, capable of standard text/graphics computing, as well as voice/video/pen communication to others individuals or computers, via modem or network (LAN/WAN) interfaces.

Still another object of invention is to provide the user with 30 an ergonomic workstation that can be adjusted to a wide range of positions and orientations, such that there will be a reduction or elimination of body stress and fatigue by the user, over long periods of use.

Still another object of the invention is to provide a modular 35 desktop workstation such that the user can configure the workstation to how he/she works, or to their choice at a particular time. For example, the user will have the choice of using a detached keyboard, pen/stylus input, mouse, trackball, handset telephone, or speaker telephone, depending on his/her wishes for 40 accomplishing a particular task.

Still another object of the invention is to provide a unit that is small and light enough for the user to easily transport it to other locations. Other objects of the invention will become evident by reading the following invention descriptions and 5 inspection of the accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1A is a side view of the desktop workstation with the display panel assembly oriented vertically and somewhat raised from its lowest position.

10 Fig. 1B is a side view of the desktop with the display panel assembly folded to its lowest inclined position, with a stylus/pen input means.

Fig. 2 is exploded perspective view of the desktop workstation with a telephone means placed on one side.

15 Fig. 3 is a general block diagram of the electrical elements of the invention.

Fig. 4 is a general flow diagram of the software that may execute on the workstation's digital computing means.

DETAILED DESCRIPTION

20 The invention can be described with reference to Fig. 1A and 1B shows a desktop workstation from the side in two different display screen orientations and modes of operation. The term desktop workstation is defined to be an interactive man-machine or man-computer interface, in which a human being can enter and view 25 data/information. The workstation or interface may or may not include a digital computing means. A display panel assembly 2 is attached to a support structure 4 via a hinge pin 5. The support structure 4 is connected to a support arm 12 via a hinge means 14. The display panel assembly 2 includes a relatively thin display 30 device further defining a viewing screen. Examples of the possible display technologies are Liquid Crystal Displays (LCD), electro-luminescent, plasma panel, and field emission displays. They may be monochrome or color, and they could be light modulator or light emitter types of displays. LCD's are most commercially available 35 flat panel display devices, available in a wide variety of sizes, shapes, resolutions and other characteristics.

Typical of these LCD's is the Sharp Electronics Corporation's LM64P90 and LM64K90 monochrome LCD's. They have a 640 x 480 display pixel format, a viewing area of 196 x 148 mm, a dot pitch of 0.30 x 0.03 mm, and cold cathode fluorescent backlight. The 40 former has 150 ms rise plus fall response time, a transmissive viewing mode, 50 Nits brightness, and 13:1 contrast ratio. The latter has a 250 ms rise plus fall response time, a transflective viewing mode, 35 Nits brightness, and 10:1 contrast ratio. For

many applications, color LCD's are required. Sharp Electronics Corp. makes several direct-view color Thin Film Transistor (TFT) LCD modules. Typical specifications for their LQ10DH11 product are a 640 (x3) X 480 display pixel format, 211 x 158 mm viewing area, 5 a 0.33(0.11x3) X 0.33 mm dot pitch, a hot cathode fluorescent backlight.

The display panel assembly 2 is free to rotate through large inclination angles (at least 90 degrees), represented by rotation A, about the hinge axis of hinge means 14. Support arms 12 and 8 10 in turn connect the display panel to the workstation a main unit 6. The main unit may include an enclosure or housing for control electronics including a digital computer, microprocessor or other control means. The display panel assembly 2 may be electrically connected to electronics located in the main unit 6, via an electrical cable routed inside the support structure 4 and support arms 12 and 8, or via a cable routed externally to the main unit. The size of main unit 6 should be small, so as to not present a large "foot print" on the desk or table. The unit should be easily 15 carried by one person. The invention may be powered by light weight batteries or it may be an AC powered workstation.

The support arm 8 is attached to support arm 12 by a hinge means 16, such that the latter arm can be rotated though rotation C about the axis of the hinge means, as shown in Fig. 1A. Support arm 8 is attached to the main unit 6 by hinge means 20, such that 25 the arm can rotate though large angles as shown in rotation B about the axis of the hinge means. Thus the above mechanical elements can work in combination, and the user is can adjust the orientation of the display panel assembly 2 in both inclination angle and elevation. The friction of each hinge is such that the user can 30 adjust the orientation by hand, and its position is either self-locking or can adjusted to lock in position. The lengths of the support arms 8 and 12 should be selected to provide the desired display screen elevation and forward viewing positions. Many different combinations of lengths may be embodied.

35 Several methods can be implemented to give the user to capability to adjust the screen in azimuth angle. One technique is to rotationally attach the display panel assembly 2 to a support structure 4 via a cylindrical hinge pin 5, so that the display can rotate through azimuth angles. The hinge pin 5 can be made hollow 40 so that electrical conductors can be routed through it to the support structure 4. Another method would be to place the main unit on stationary base structure via a lazy-susan structure. Rubber feet may be placed under the main unit, as shown in the figure. The weight of the display panel assembly 2 should be as

low as possible, and the mass of the main unit and its electronics should be large enough so that if the display assembly is adjusted in the extreme forward position, the unit will remain physically and gravitationally stable. A computer keyboard unit 7 is shown 5 connected to the main unit 6 via an electrical cable 9. The computer keyboard unit 7 may be attached or detached. If it is a detached keyboard, the electrical signals may be transmitted to the computer via wires or electromagnetic radiation means.

Fig. 1B shows the workstation of in Fig. 1A, except the 10 display panel is folded down to its lowest inclined position and a stylus input means 22 is included. The stylus input means is defined to be a stylus or pen position encoding device that encodes, in two or three dimensions, the position of a hand-held stylus, as the user moves it over an active area corresponding to the display screen. The screen of the display panel is facing 15 upward and at a convenient inclined angle for user hand writing, drawing and sketching with the stylus or pen. An electrical wire/cable 23 may be used to connect the pen/stylus to the control 20 electronics in the main unit. A natural inclined angle of the screen for stylus/pen data input is roughly 30 degrees from the horizontal. However, the display panel assembly may be locked into 25 position at a multiplicity of orientations.

Another embodiment is shown in Fig. 2, which presents a 30 perspective view of another embodiment of the invention, where several elements are shown in exploded view, for clarity. A display panel assembly 2 including its display screen 3 is rotationally connected to the support structure 4 via the cylindrical hinge pin 5. The display panel assembly is then free to rotate through wide azimuth angles D as shown. The support structure 4 is connected to support arm pairs 12A and 12B via hinge means 14A and 14B. The cylindrical shafts of hinges 14A and 14B, which may be threaded, fit in the round holes of the support arm pairs 12A and 12B. Support arm pair 8A and 8B is attached to the 35 previous arm pair at hinge elements 16A, 16B and 16C, where element 16B is a long shaft, the ends of which may be threaded. The other ends of support arm pair 8A and 8B are attached to the main unit 6 via hinges 20A and 20B. The friction of each hinge means may be adjusted by a threaded shaft or screw 19 and a standard nut 17 or a finger tightened nut/knob 17A. The friction should be sufficient 40 to support the display panel assembly under the gravitational and normal hand writing/sketching forces.

As shown in Fig. 2, a telephone unit may be added or integrated into the desktop workstation. A telephone handset 26 and cord 32 may be located either side of the workstation. A telephone

5 keypad 28 should be placed in a convenient location of the user. For a hands-free telephone operation, a microphone 30 and speaker 36 may be included. The telephone unit may be attached or detached from the main unit. The telephone may function during workstation operation and/or independently of the workstation operation. A computer keyboard, mouse or trackball devices may be included, in addition to the stylus/pen input means. All controls should be designed to be simple and easy to use.

10 Fig. 3 shows a block diagram of the basic electrical elements of the computer workstation. The pen/stylus input means' electronics 36 can be interfaced directly to flat panel display device electronics 38. Examples of available products that have combined these functions are the Super-K™ display tablet from SuperScript Inc., Video Tablet from Kurta® Corporation, and the PL-100 Integrated Tablet for Wacom Technology Corp. Typically, these products are connected to a controller card in the computer's I/O bus, via a cable. Specifications for such display-tablet include: active area 7.56 by 5.67 inches, accuracy ± 0.02 inch, resolution 1016 PPI, data transfer rate 270 coordinate pairs/sec., pen slew rate up to 135 IPS without significant distortion, and stylus/pen weight 15 grams.

15 20 25 30 35 40 As shown in the figure the flat panel display is electrically connected to the workstation microcomputer/controller 44. The microcomputer may be any one of several commercially available products, such as the Intel™ 86286, 86386 or 86486 processors, Motorola Corporation's 68030 or 68040 processors, as well as several others. If the workstation is to be battery powered, then low voltage (3V) low-power microprocessors should be used. The microcomputer/controller 44 may be embodied by several means.

30 35 40 One available microcomputer system that may be used, is the Moby Brick product manufactured by Ergo Computing of Peabody MA. The Moby Brick product consists of a 386/486 CPU, with 4 to 32MB RAM, hard disk s from 170MB to 1GB, built in video controller, a 3.5 inch 1.44MB floppy drive, two serial ports, one parallel port and one ISA 16 bit half length card slot. All the above is built into a 7.9 x 11.3 x 3.3 inch module that weighs 8.7 lbs. The CPU required by the invention may be a 20 MHz 386SX, 33/40MHz 386DX, or the 33MHz 486DX. Either internal or external modems may be embodied in to the system. An optional expansion chassis may be added to the system with four slots for ISA cards.

Fig. 4 shows a general flow diagram of typical stored program software that may execute in the microcomputer or processor 44. Many commercial available operating systems, window environment and

application software are available to run in the microcomputer. Typical operating systems that could be used include Microsoft Corporation's MS-DOS™, IBM's OS/2™, Go Corporation's Pen Point or various companies' UNIX products. Possible windowing environments 5 include Microsoft's Windows™ 3.x and Windows for Pen™, Hewlett-Packard's New Wave™, or X-Windows from various companies. Software may be pen centric like Pen Point™ software or it may be just pen/mouse aware. As shown in Fig. 4, after a standard power up and the system diagnostics and checkout is completed the operating 10 system is loaded. Depending on the desired configuration a number of device driver, TSR's, communication programs and pen/stylus control programs may be loaded. The workstation should be capable of either running windows or non-windows environments.

15 The microcomputer/controller 44 of Fig. 3 includes associated support electronics, I/O devices and power supply. All the above should be compact in size, so that the size of the overall desktop workstation is as small as practical. The advantage of small size is that it provides a smallest footprint of the desk. This is important in office environments, where desk space is at a premium. 20 The main unit's footprint dimensions, on the desktop, could be in the range of 15 by 13 inches, depending of the size of the screen and whether of telephone handset is included.

25 The keyboard function 42 may be electrically connected to the microcomputer/controller 44. A standard mouse/trackball unit 46 may be connected to the microcomputer via an I/O card or serial port in the standard manner. Both the pen and mouse/trackball interfaces may be desirable in certain applications. An external communication means 46 is connected to the microprocessor. The 30 communications means could be embodied by a communications I/O card, internal/external modem or other communication means. However embodied, the workstation shall have the capability to communicate data (text, graphics, video, and voice) interactively on either Wide Area Networks (WAN) 50 or Local Area Networks (LAN) 52. The WAN in its simplest form may consist for two workstations 35 connected to each other via internal/external modems over standard or hi-speed telephone lines.

40 Either an external or internal (built-in) telephone/speaker phone 48 may be connected to the microprocessor/controller. It may be integrated into the workstation or embodied as a stand alone device, depending on the user's requirements. The telephone/speaker phone may also be connected to ordinary telephones lines 54 or wireless/cellular networks 56. The primary purpose of the 45 external communication means of the workstation is to provide two way interactive text, graphics (including pen/stylus), video and

5 voice/audio communication to: (1) other users operating similar workstations (at the same time or unattended), and/or (2) one or more computers on a network of computers or terminals. Other standard computing and communication components may be added to the invention that are obvious to those skilled in the art.

10 In another embodiment, the microprocessor and support electronics 44 can be located at the display panel assembly 2, instead of the main unit 6. For example, they may be located on one or more printed circuit boards surrounding and behind the display screen. Such an implementation with battery power is well known to those skilled in the art. ¹¹ The display panel and computer assembly can then be removed from the support structure 4 and hinge pin 5, as shown in Fig. 1A by a typical removal direction E. This can be accomplished by a simple plug and socket arrangement at the bottom of the display panel assembly. An advantage of this implementation is that two modes of user operation are then possible. One is the desktop operation as described above. The other is a portable mobile display-tablet operation. The user has the option to remove the display-computer unit from the socket, and use it as notebook computer or display-tablet.

15 ~~16~~ The scope of the invention disclosed here should be determined by the appended claims and their legal equivalents, rather than by the examples given above.

20 ~~17~~
